INVESTOR IN PEOPLE

**PRIORITY
DOCUMENT**
SUBMITTED OR TRANSMITTED IN
COMPLIANCE WITH RULE 17.1(a) OR (b)

The Patent Office
Concept House
Cardiff Road
Newport
South Wales
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Stephen Hordley

Is a statement of inventorship and of right to grant of a patent required in support of this request? (Answer 'Yes' if:

Yes

- (a) any applicant named in part 3 is not an inventor, or
- (b) there is an inventor who is not named as an applicant, or
- (c) any named applicant is a corporate body. (See note (d))

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

1) If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.

2) Write your answers in capital letters using black ink or you may type them.

3) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.

4) If you have answered 'Yes' Patents Form 7/77 will need to be filed.

5) Once you have filled in the form you must remember to sign and date it.

6) For details of the fee and ways to pay please contact the Patent Office.

Patents Form 1/77

THERAPEUTIC METHODS, COMPOSITIONS AND USES

The present invention concerns methods and compositions useful in the therapeutic treatment of mammals, especially humans. In particular, the invention
5 concerns methods and compositions for treatment or prevention of infection by the hepatitis C virus (HCV).

HCV is a major human pathogen, infecting about 3 percent of the world's population, and is a major cause of liver disease. A striking feature of HCV infection is the tendency towards a chronic status leading to liver diseases such as chronic
10 hepatitis, cirrhosis and hepatocellular carcinoma. HCV infection is also implicated in mixed cryoglobulinemia, a B-lymphocyte proliferative disorder.

A major obstacle in understanding the mechanism of HCV infection and in the design and testing of appropriate therapies is the lack of knowledge of the HCV cellular receptors and the mechanisms by which they mediate viral attachment and
15 entry to cells. At least three different receptors have been implicated, namely the low density lipoprotein (LDL) receptor (Agnello *et al*, *PNAS*, 1999, 96, 12766-71); the CD81 receptor (Pileri *et al*, *Science*, 1998, 282, 938-41); and the scavenger receptor type B class I (SRB1) (WO 03/040726, Scarselli *et al*, *EMBO*, 2002, 12, 58017-25 and Bartosch *et al*, *J. Biol. Chem.*, 2003, 278, 41624-30).

20 Peroxisome proliferator receptors (PPARs) form part of the nuclear receptor superfamily and are involved in the control of lipid metabolism. They exist as α , β , γ and δ subtypes (for a review, see Desvergne and Wahli, *Endocrine Reviews*, 1999, 20, 649-88). PPAR activation has been linked to diverse phenomena such as fatty acid metabolism, inflammatory responses, atherosclerosis and control of the cell cycle.
25 However, there has hitherto been no disclosure of a link between PPAR activity and HCV infection.

According to the present invention, there is provided the use of a PPAR α agonist for the manufacture of a medicament for treatment or prevention of HCV infection in a mammal.

30 There is further provided a method of treating or preventing HCV infection in a mammalian subject comprising administration to that subject of a therapeutically effective amount of a PPAR α agonist. Typically, the mammalian subject is human.

Figure 1 shows the numbers of copies of HCV RNA detected when cultured human hepatocytes were incubated with serum from an HCV-infected patient in the presence and absence of fenofibric acid.

It is believed that PPAR α agonism has the effect of inhibiting entry of HCV to hepatocytes, possibly through a reduction of the expression and/or cell surface display of SRB1. Such effect is useful both in preventing infection by HCV in the first place and in arresting the progress of an existing infection by preventing further cells from becoming infected. Thus, in accordance with the invention, the PPAR α agonist may usefully be administered to subjects at risk of contracting HCV infection (prophylaxis) or to subjects who have already contracted HCV infection (active treatment).

According to a further aspect of the invention, there is provided a method of inhibiting entry of HCV to a cell comprising contacting said cell with a PPAR α agonist. Preferably the cell is a hepatocyte.

In principle, any compound known or discovered to have PPAR α agonist activity may be used in the invention, but compounds suitable for oral administration are preferred. Compounds having PPAR α agonist activity may be identified using published assay methods such as the cell-based transactivation assay described in Berger *et al*, *J.Biol.Chem.*, 1999, 274, 6718-25. Suitable compounds include those which are selective PPAR α agonists and those which combine activity at the alpha receptor with activity at one or more of the other subtypes, e.g. PPAR α / γ dual agonists. Known selective PPAR α agonists include fenofibrate, bezafibrate, ciprofibrate, clofibrate, etofibrate, other fibric acid derivatives, gemcarbene, gemfibrozil, GW 7647, BM 170744, LY 518674, AtromidTM, LopidTM and TricorTM, as well as compounds disclosed in Adams *et al* *Bioorg. Med. Chem. Lett.*, 2003, 13, 3185-90. Examples of PPAR α / γ dual agonists include KRP-297 (MK-0767), muraglitazar (BMS-298585), farglitazar, ragaglitazar, tesaglitazar (AZ-242), JT-501, GW-2570, GI-262579, CLX-0940, GW-1536, GW-1929, GW-2433, L-796449, LR-90, SB-219994, LY-578, LY-4655608, LSN-862, LY-510929 and LY-929, as well as compounds disclosed in Desai *et al* *Bioorg. Med. Chem. Lett.*, 2003, 13, 3541-4 and in Desai *et al* *Bioorg. Med. Chem. Lett.*, 2003, 13, 2795. Further disclosure of selective PPAR α agonists or PPAR α / γ dual agonists appears in WO

97/28115, WO 00/78312, WO 00/78313, WO 00/196321, WO 00/181327, WO 00/134148, WO 02/064094, WO 02/060434, WO 02/26729, WO 01/60807, EP1194147, EP1194146, WO 03/066581 and WO 03/075911.

5 Preferred compounds for use in the invention include fenofibrate, bezafibrate, ciprofibrate, gemfibrozil and MK-0767.

10 The PPAR α agonist may be administered alone or in combination with one or more additional therapeutic agents known to be useful in the treatment or prevention of HCV infection or the symptoms thereof. Examples of such additional therapeutic agents include interferon- α , pegylated interferon- α , ribavirin, HCV NS3 protease inhibitors, HCV polymerase inhibitors, anti-HCV antibodies and HCV vaccines. As used herein, the expression "in combination with" requires that therapeutically effective amounts of both the PPAR α agonist and the additional therapeutic agent are administered to the subject, but places no restriction on the manner in which this is achieved. Thus, the two species may be combined in a single dosage form for simultaneous administration to the subject, or may be provided in separate dosage forms for simultaneous or sequential administration to the subject. Sequential administration may be close in time or remote in time, e.g. one species administered in the morning and the other in the evening. The separate species may be administered at the same frequency or at different frequencies, e.g. one species once a day and the other two or more times a day. The separate species may be administered by the same route or by different routes, e.g. one species orally and the other parenterally, although oral administration of both species is preferred, where possible. When the additional therapeutic agent is a vaccine or antibody, it will typically be administered parenterally and separately from the PPAR α agonist.

25 In a further aspect, the invention provides a pharmaceutical composition or kit comprising, in the same or separate pharmaceutically acceptable carriers, a PPAR α agonist and one or more therapeutic agents selected from interferon- α , pegylated interferon- α , ribavirin, HCV NS3 protease inhibitors, HCV polymerase inhibitors, anti-HCV antibodies and HCV vaccines. Kits comprising separately-formulated therapeutic agents will typically comprise instructions for the separate administration of the therapeutic agents.

The PPAR α agonists and optional additional therapeutic agent(s) are typically used in the form of pharmaceutical compositions comprising the relevant active ingredient(s) and a pharmaceutically acceptable carrier. Where the active ingredient comprises an acidic or basic group, said ingredient may be in the form of the free acid or base or in the form a pharmaceutically acceptable salt. Preferably the pharmaceutical compositions are in unit dosage forms such as tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, metered aerosol or liquid sprays, drops, ampoules, transdermal patches, auto-injector devices or suppositories; for oral, parenteral, intranasal, sublingual or rectal administration, or for administration by inhalation or insufflation. The principal active ingredient typically is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate and dicalcium phosphate, or gums, dispersing agents, suspending agents or surfactants such as sorbitan monooleate and polyethylene glycol, and other pharmaceutical diluents, e.g. sterile water, to form a homogeneous preformulation composition containing a compound of the present invention, or a pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. Typical unit dosage forms contain from 1 to 100 mg, for example 1, 2, 5, 10, 25, 50 or 100 mg, of the active ingredient. Tablets or pills of the composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the compositions useful in the present invention may be incorporated for administration orally or by injection include aqueous solutions, liquid- or gel-filled capsules, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil or coconut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, poly(ethylene glycol), poly(vinylpyrrolidone) or gelatin.

For treating or preventing HCV infection, a suitable dosage levels of the PPAR α agonist are similar with published values for the compounds concerned when used for other therapeutic purposes (e.g. control of lipid levels), or may be determined by methods known to those skilled in the art. Typical levels are in the range of about 0.01 to 250 mg/kg per day, preferably about 0.01 to 100 mg/kg per day, and more preferably about 0.05 to 50 mg/kg of body weight per day, of the active compound. Any suitable dosing regimen may be used, e.g. 1-4 times daily.

A suitable dose of fenofibrate is 100 - 200mg per adult person daily.

EXAMPLES

Example 1. Inhibition of HCV infection of cultured Human Hepatocytes by Fenofibric Acid.

Isolated human hepatocytes from surgical liver resection were seeded in 24 well microplates at the density of 3×10^5 cells/well. Cells were allowed to attach and recover 24 hours and then medium was replaced with a fresh one containing different concentrations of fenofibric acid (50 μ M and 500 μ M). Hepatocytes were incubated 24 hours with the indicated amounts of fenofibric acid, then medium was replaced with fresh one containing the same amounts of fenofibric acid and a fixed amount (100 μ l) of an infectious human serum from a patient chronically infected with HCV. Cells were incubated 18 hours with the virus to allow infection, then washed and incubated for four days. Total RNA was extracted and viral replication was measured by quantitative RT-PCR.

Typically, 10^4 to 10^5 copies of genomes per well are detected after four days from infection. To be sure that the measured viral RNA derived from active

replication, a small molecule inhibitor of the viral replicase was included as a positive control.

5 Viral replication was measured on total RNA by quantitative PCR and expressed as number of HCV copies/350,000 cells. The experiment was performed in triplicate wells and values are shown with standard deviations. Fenofibric acid was dissolved in DMSO and tested at 50 μ M and 500 μ M. Final concentration of DMSO in the assay was 0.5%, therefore all the control infections (not-inhibited and with the HCV replicase inhibitor) were done in the presence of 0.5% DMSO. The results are shown in figure 1, and it is clear that fenofibric acid reduced the infectivity by up to
10 90%.

Example 2

 A hard gelatine capsule containing 100 mg of fenofibrate may be administered orally to a 60.Kg adult patient in need thereof for the treatment of HCV infection.
15 Such administration may take place twice or three times a day.
